

# Hello World

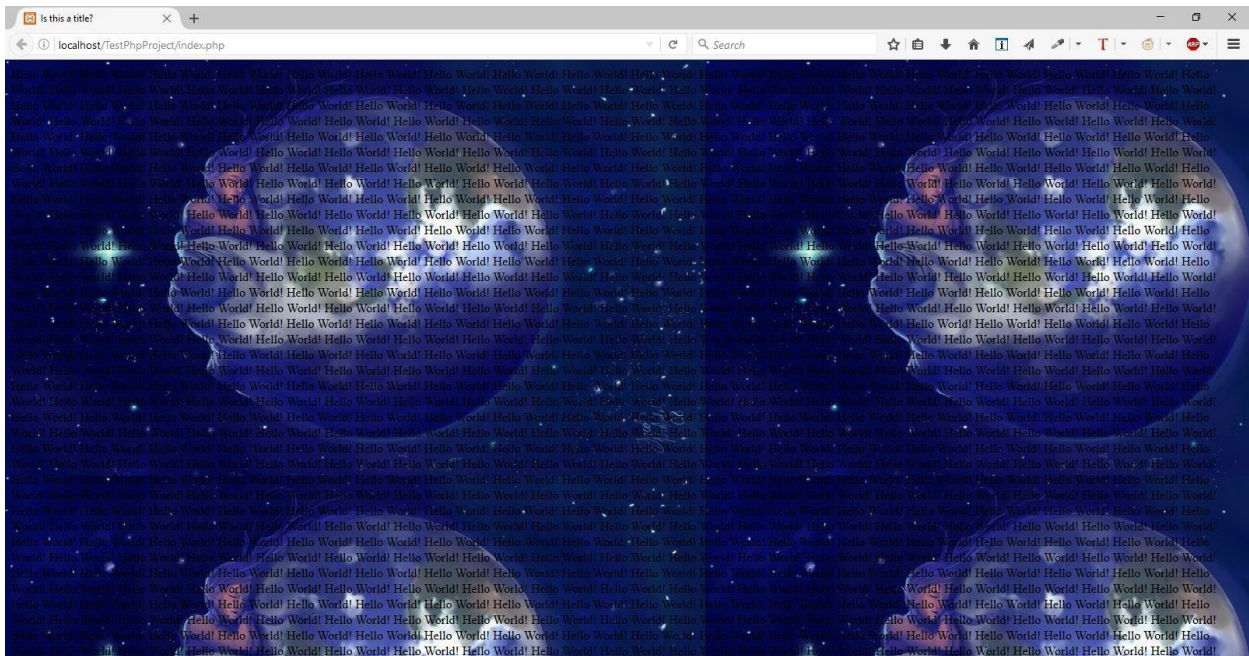

Name: Hayden Pack

Teacher: David Retterer

Subject: Net-Centric Computer Programming

Date: 1/24/2017

I created my copy of “Hello World!” by downloading XAMPP, using that to run Apache and MySQL, then using NetBeans to create the php file which is the website. From there I had the desire to use an image as the background which led me to use google to find a thread where I eventually found the code, background-image:url(‘name of image.extension’); , which allowed me to set the background after placing the image in the folder with the program. After setting the background I found that the “Hello World!” was difficult to see thus I decided to find a way to output “Hello World!” multiple times without retyping the echo command. Once again using google I found what I was looking for using the command str\_repeat.

The code:

```
<html>

<head>

    <meta charset="UTF-8">

    <title>Is this a title?</title>

</head>
```

```
<body>
<?php
    echo str_repeat("Hello World! ",665);
?>
</body>    <style
type="text/css">
    body
    {
        background-image:url('earth.jpg');
    }
</style>
</html>
```
